

Candidate Assignment: Marketing Microsite

Build a small deployed microsite that can publish a post to a controlled business account and then fetch and display metrics for that content.

Deliverable: working microsite

Deployment: infrastructure as code

Implementation: orchestrated + direct API

Assignment

Choose

one

approved platform and build a small web app that can:

1. Publish a test post to a safe dummy business page, account, or channel.
2. Fetch metrics for that published content or the owned page/account and display them.

1. Platform Options

Platform	Typical Content	Typical Metrics
Buffer	Social post	Post performance and engagement metrics
LinkedIn Company Pages	Company page post	Impressions, clicks, engagements, page statistics
Pinterest Business	Pin	Pin and account analytics
Facebook Pages	Page post	Page or post insights
YouTube	Test video upload	Views, watch metrics, likes, comments

2. Required Implementation

Microsite UI

- A small interface with at least two primary actions: `Post` and `Fetch metrics`.
- Show the created content ID, timestamps, and fetched metrics.
- Show which execution mode was used.

Two Execution Modes

- **Orchestrated mode:** use an existing integration layer such as `Buffer` , `n8n` , or `Zapier MCP` .
- **Direct mode:** implement the same workflow with direct custom API calls, without relying on that integration layer.

3. Deployment Requirement

Infrastructure as code is required

The microsite must be deployed using code-defined infrastructure rather than manual setup. Acceptable approaches include `Terraform` , `OpenTofu` , `Pulumi` , or equivalent provider-native infrastructure definitions committed in the repository.

You may deploy to a low-cost hosting target such as `Cloudflare Pages` , `Vercel` , or `Netlify` , provided the deployment is reproducible from the repository.

4. Deliverables

1. Application source code.
2. Code for the orchestrated integration path.
3. Code for the direct API path.
4. Infrastructure-as-code files for deployment.
5. A short README with setup, run, and deploy instructions.

5. Minimum Acceptance Criteria

- The app can publish a test post to a controlled dummy business account/page/channel.
- The app can fetch metrics for that content and display them clearly.
- Both orchestrated and direct execution modes are implemented.
- The app is deployed and the deployment is reproducible using infrastructure as code.
- Secrets are handled outside source code.

6. Optional Nice-to-Haves

- A normalized internal metrics format across both modes.
- A raw-response viewer for debugging.
- A simple audit log of requests and results.
- A refresh action for metrics.

7. Notes

Use a safe dummy business page, account, or channel that you control for the assignment.

Keep the implementation practical and appropriately scoped. The goal is a working end-to-end slice, not a full product.

Candidate-facing assignment version.
